This is a sample guide for usage of the Directories export to Excel Executable:

Sample usage of the ExcelDirectories.exe Executable:

### Step1 – Open the ExcelDirectories.exe Executable:

After opening the exe file you will see the following window shown below.
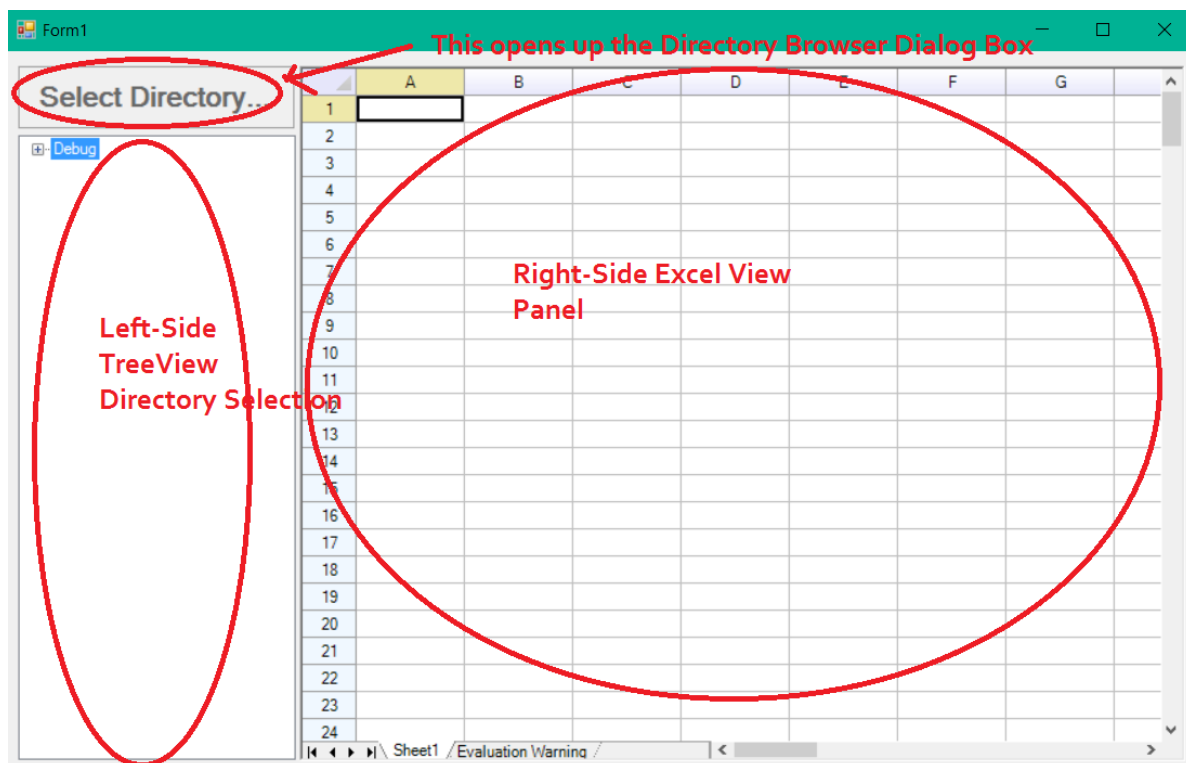

You start by making a selection from the "Select Directory.." button on the top-left side of the application.

Step2 – Select the Directory you want to view contents in:

After clicking on the "Select Directory.." button you need to make a folder selection shown in the screen below:

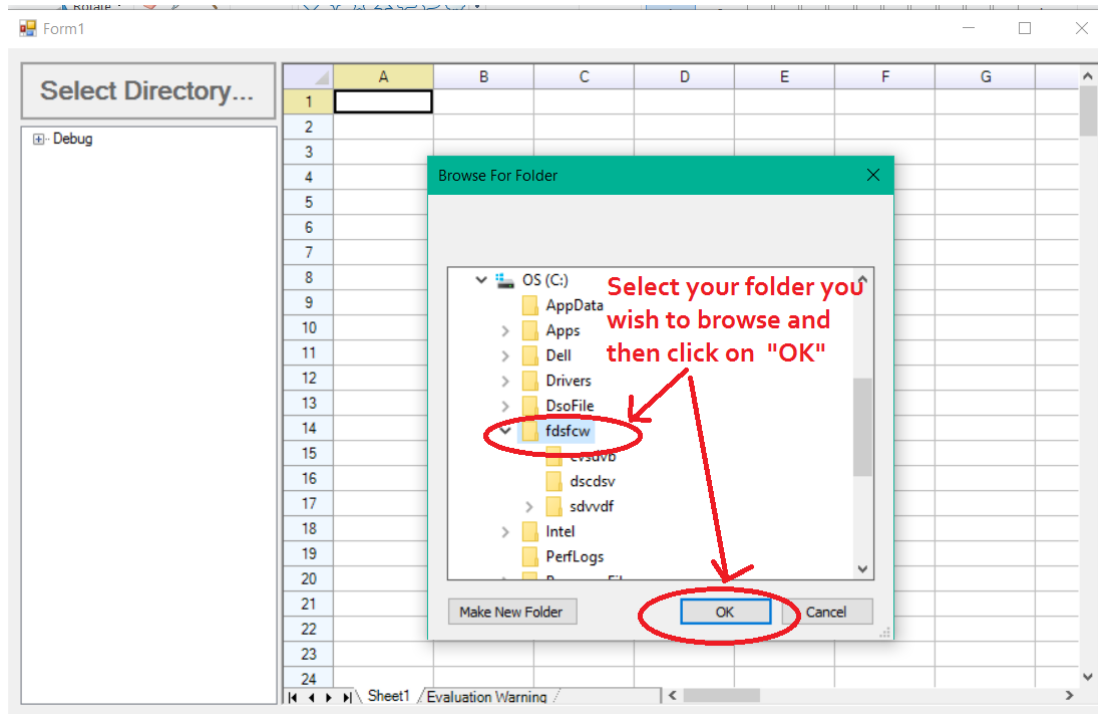

Step 3 – Click on the Directory you would like to process from the left-side panel tree view:

After selecting your preferred folder, it will appear on the left-hand side panel as a tree-view.
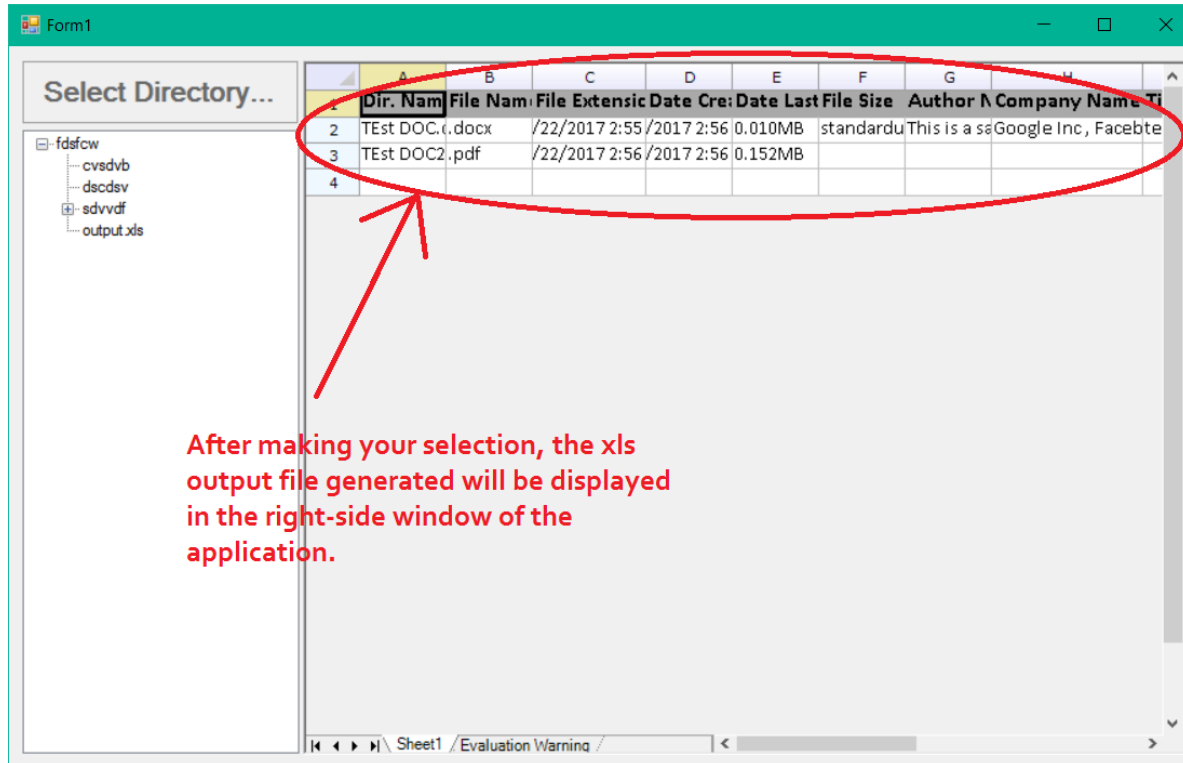

From the tree-view presented when you expand any of the top level directories, you might get a notification to replace the output generated by the program in case that you already run the program more than once.

This is displayed below. You need to press "Yes" on the message box in order to continue.
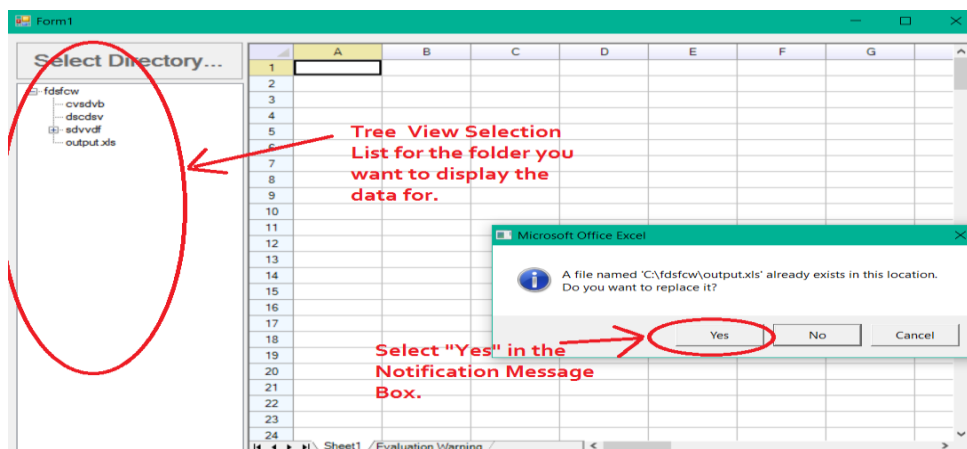

Step4 – Wait until the output file is loaded in the Right-Side Excel Spreadsheet:

This is the final step of the documentation. The output is presented as expected.

After making your selection, the xls output file generated will be displayed in the right-side window of the application.

NOTE: In case you don't have the appropriate read account privileges in a specific directory the program will cause an error and you will need to close it.
